BRAHMI OIL

A botanical oil ingredient for personal-care and formulation development.

BRAHMI • BOTANICAL INGREDIENT • FORMULATION DEVELOPMENT

Product overview

Brahmi is a common name used for more than one botanical, particularly *Bacopa monnieri* and, in some markets, *Centella asiatica*. The product image identifies Bacopa monnieri, but the actual supplied oil must be verified against its botanical source and batch documentation. “Brahmi Oil” may be an infused oil, an extract in a carrier oil, or another preparation; it should not automatically be described as pure essential oil.

Ingredient profile

The appearance, aroma, composition and strength depend on the botanical species, plant part, extraction or infusion method, carrier oil and processing. Use the supplier's specification to describe the actual material.

Potential application areas

- Cosmetic and personal-care formulation, where suitable
- Hair and scalp product development, subject to safety review
- Massage and body-care formulation trials
- Botanical ingredient research and development

Formulation considerations

Check carrier oil, solubility or dispersibility, colour, odour, stability and compatibility in the intended base. Confirm the grade, permitted use levels and regulatory requirements for the target market.

Identity to verify

Confirm the botanical name (*Bacopa monnieri* or another species), plant part, whether the product is infused or extracted, carrier oil, extract ratio or concentration, and any standardised constituents.

FOR INGREDIENT BUYERS & FORMULATORS

Quality checks, batch documentation and responsible handling.

Quality and evaluation checklist

Review the supplier's technical documents and test a representative sample in the intended product base. Check appearance, aroma, carrier compatibility, stability, microbiological quality where relevant, and packaging suitability.

For buyers and formulators	Batch documents to request
• Confirm botanical identity and plant part. • Confirm whether it is an infused oil or extract. • Review a representative sample. • Assess compatibility and stability. • Verify application-specific safety and regulatory requirements.	• Batch-specific Certificate of Analysis (COA). • Safety Data Sheet (SDS), where applicable. • Botanical identity and source details. • Carrier oil, extraction method and ratio. • Relevant microbial, contaminant and composition tests.

Storage and handling

Follow the supplier's storage instructions. Protect the product from excessive heat, light and air exposure where relevant to its formulation. Keep the container tightly closed and use only in applications supported by the verified grade and technical documents. Do not ingest or apply undiluted unless the specific product is expressly approved for that use.
